Measurement

Lesson 1

Lesson One – Imperial Measures of Length

There are two main measurement systems used today in Canada:

- Systeme Internationale d'unités (SI) or the Metric System (millimetre, centimetre, metre, kilometre)
- Imperial System (inches, feet, yard, mile)

Imperial and Metric Ruler

Imperial – each inch is broken down into $\frac{1}{16}$ in, with other units of measure being $\frac{1}{8}$ in, $\frac{1}{4}$ in, $\frac{1}{2}$ in

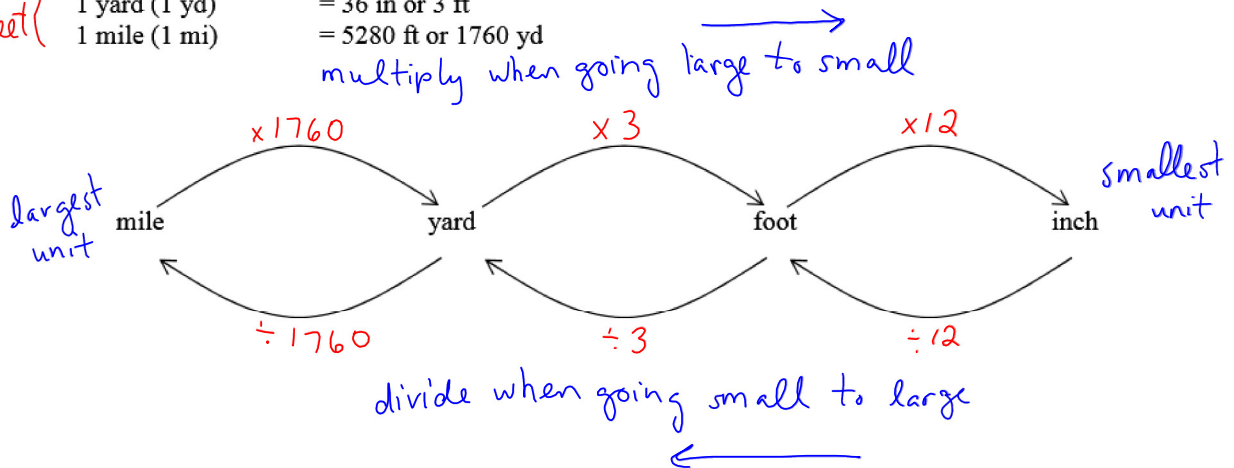

Metric – each centimeter is broken down into 10 millimetres.

Imperial:

on formula sheet

- 1 foot (1 ft or 1') = 12 inches (12 in or 12")
- 1 yard (1 yd) = 36 in or 3 ft
- 1 mile (1 mi) = 5280 ft or 1760 yd

MAAPC20S

Measurement

Lesson 1

Metric:

- 1 cm = 10 mm
- 1 m = 100 cm
- 1 km = 1000 m

Estimation: Determine the most suitable units in both the imperial and metric systems for measuring the following:

	Metric	Imperial
Your height	m and/or cm	ft and inches
Distance from Winnipeg to Steinbach	km	miles
Height of Pop Can	cm	in
Length of a Sheet of Curling Ice	m	yds
Diameter of a Dime	mm	in

- A = $\underline{26 \text{ mm or } 2.6 \text{ cm}}$
- B = $\underline{52 \text{ mm or } 5.2 \text{ cm}}$
- C = $\underline{\frac{1}{16} \text{ ''}}$
- D = $\underline{1 \frac{5}{16} \text{ ''}}$
- E = $\underline{1 \frac{3}{4} \text{ ''}}$
- F = $\underline{2 \frac{1}{2} \text{ ''}}$
- G = $\underline{3 \frac{3}{8} \text{ ''}}$

Measurement

Lesson 1

Example 1 – Converting Between Imperial Units

Convert 5 yards to feet

$$5 \cancel{\text{yds}} \times 3 \text{ft} / \cancel{\text{yd}} = 15 \text{ft}$$

or

$$\frac{1 \text{yd}}{3 \text{ft}} = \frac{5 \text{yds}}{x \text{ft}}$$

cross multiply $1 \text{yd} \cdot x \text{ft} = 5 \text{yds} \cdot 3 \text{ft}$

$$x \text{ft} = \frac{5 \text{yds} \cdot 3 \text{ft}}{1 \text{yd}}$$

$$x = 15 \text{ft}$$

Convert 51 inches to yards, feet and inches

to ft and inches $\frac{51}{12} = 4 \frac{3}{12}$ ft mixed fraction

12 inches in 1 foot $\frac{3 \text{ft in}}{1 \text{yd}} \rightarrow \frac{4}{3} = 1 \frac{1}{3}$

4 ft · 3 in $\frac{4}{3} = 1 \text{yd } 1 \text{ft}$

$$\therefore 1 \text{yd } 1 \text{ft } 3 \text{in}$$

3 ft 2 in + 7 ft 11 in

$$\begin{array}{r} 10 \text{ft } 13 \text{in} \\ +1 \quad -12 \\ \hline 11 \text{ft } 1 \text{in} \end{array}$$

12 in = 1 ft
 $\therefore 13 \text{in} = 1 \text{ft } 1 \text{in}$

3 mi - 250 ft

← need to be in same units to subtract

mi → ft $1 \text{mi} = 5280 \text{ft}$ ← from formula sheet

$$3 \cancel{\text{mi}} \times 5280 \frac{\text{ft}}{\cancel{\text{mi}}} = 15840 \text{ft}$$

$$15840 \text{ft} - 250 \text{ft}$$

$$15590 \text{ft}$$

Measurement

Lesson 1

Example 2 – Solving Problems Involving Converting Between Units

Ben buys baseboard for a bedroom. The perimeter of the bedroom, excluding closets and doorway, is 37 ft.

- What length of baseboard is needed, in yards and feet?
- The baseboard material is sold by the yard. It costs \$5.99/yd. What is the cost of material before taxes?

$$\frac{37 \text{ ft}}{3} = 12 \frac{1}{3} \text{ yds}$$

$$12 \text{ yds } 1 \text{ ft}$$

$$\therefore \text{ Ben needs } 13 \text{ yds}$$

$$13 \text{ yds} \times \$5.99/\text{yd} = \$77.87$$

$$3 \text{ ft in } \rightarrow \frac{1 \text{ yd}}{3}$$

Tyrell has 4 yd. of cord to make friendship bracelets. Each bracelet needs 8 in. of cord. How many bracelets can Tyrell make?

$$1 \text{ yd} = 36 \text{ in} \leftarrow \text{from formula sheet}$$

$$\therefore 4 \text{ yd} \cdot 36 \text{ in/yd} = 144 \text{ in}$$

$$144 \div 8 = 18 \text{ bracelets}$$

Example 3 – Solving a Problem Involving Scale Diagrams

On the map with a scale of 1:4 750 000, the distance between Seward and Anchorage in Alaska is $1 \frac{3}{4}$ in. What is the distance between these two towns to the nearest mile?

$$1 \text{ in} = 4\,750\,000 \text{ in}$$

$$\therefore 1.75 \times 4\,750\,000 = 8\,312\,500 \text{ in}$$

$$8\,312\,500 \text{ in} \cdot \frac{1 \text{ ft}}{12 \text{ in}} \cdot \frac{1 \text{ yd}}{3 \text{ ft}} \cdot \frac{1 \text{ mile}}{1760 \text{ yds}} = 131 \text{ miles}$$

(see video for setting up ratios so units cancel/divide out)

OR

$$1 \text{ mile} = 1760 \times 3 \times 12 = 63\,360 \text{ in}$$

$$\therefore \frac{8\,312\,500}{63\,360} = 131 \text{ miles}$$
