MAAPC20S Linear Functions Lesson 5

Lesson Five – Slope-Intercepts Form of the Equation

A linear equation is an equation where the graph would be a [redacted] line when drawn in the coordinate plane.

Slope-Intercept Form of the Equation of a Linear Function

$y = mx + b$

slope, y-intercept

variables

Example 1

The graph of a linear function has slope $\frac{3}{5}$ and y-intercept -4. Write an equation for this function.

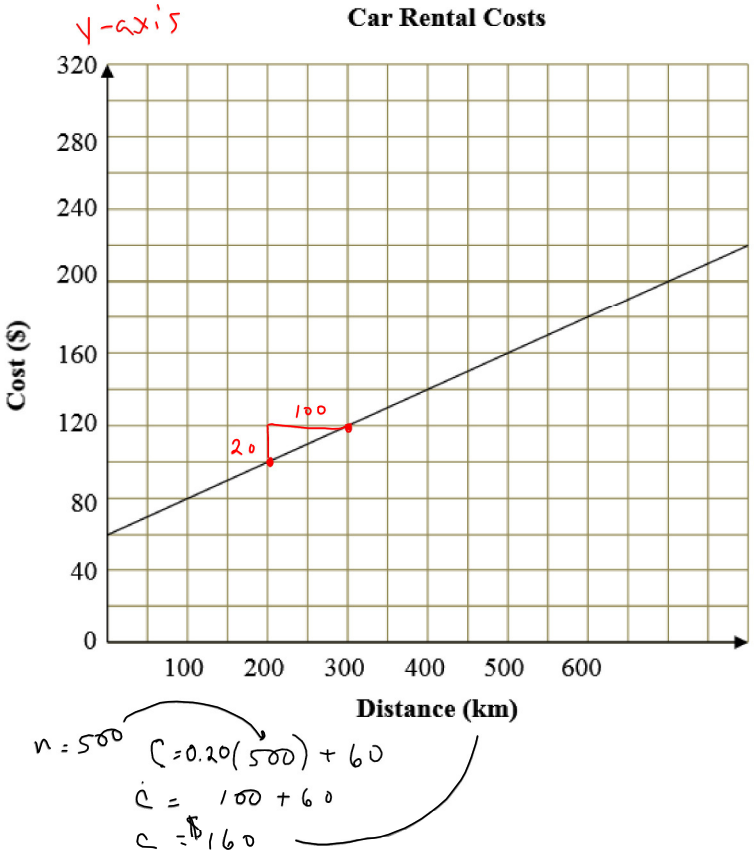
$y = mx + b$ (m, b)

$y = \frac{3}{5}x + (-4)$

$y = \frac{3}{5}x - 4$

Example 2

Write an equation given the following graph.



$y = mx + b$

① Determine slope (m)

$m = \frac{rise}{run}$

choose 2 pts, make a triangle

$m = \frac{20}{100}$

$m = \frac{1}{5}$

② Determine the y-intercept (where the graph crosses the y-axis)

$b = 60$

$\therefore y = \frac{1}{5}x + 60$

$C = 0.20n + 60$

cost/km, initial cost

$n = 500$

$C = 0.20(500) + 60$

$C = 100 + 60$

$C = \$160$

MAAPC20S Linear Functions Lesson 5

Example 3

The student council sponsored a dance. A ticket cost $5 and the cost for the DJ was $300.

a) Write an equation for the profit, P dollars, on the sale of t tickets.
b) Suppose 123 bought tickets. What was the profit?
c) Suppose the profit was $350. How many people bought tickets?
d) Could the profit be exactly $146? Justify the answer.

a) $P = 5n - 300$
$5/ticket, pay the DJ

b) $P(n) = 5n - 300$
$P(123) = 5(123) - 300$ ← functional notation
$= \$315$

c) $P = 350$ $P(n) = 5n - 300$
$350 = 5n - 300$
$\frac{650}{5} = \frac{5n}{5}$
$130 = n$ ∴ 130 ppl
The profit is $350 when 130 ppl buy tix.

d) has to be a multiple of 5 since $5/ticket and $300 are both multiples of 5 which $146 isn't so no.
or
$146 + 300 = 5n - 300 + 300$
$\frac{446}{5} = \frac{\$n}{\$}$
$89.2 = n$
↑ not logical
can't sell 0.2 of a ticket or have 89.2 ppl.

Prove a point is on a given line

We can prove whether or not a given point P (x, y) is on a line by substituting the x and y-coordinates into the equation and solving for the Left Hand Side (LHS) and the Right Hand Side (RHS). If both sides are ***equal***, the point is on the line.

Example 4

Determine whether P (4, 3) is on the line $3x - 2y - 6 = 0$

x y

Sub (4, 3) in for (x, y)

LHS	RHS
$3x - 2y - 6$	0
$3(4) - 2(3) - 6$	0
$12 - 6 - 6$	
0	0
LHS =	RHS

∴ (4, 3) is on the line

Assignment: Pg 362; 5, 11, 12 (a,b), 13, 19, 21
